Measuring the reliability of a natural gas refrigeration plant:
Uncertainty propagation and quantification with polynomial chaos
expansion based sensitivity analysis

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

HIGHLIGHTS

- Uncertainty quantification was performed to measure the reliability of natural gas liquefaction process.
- Surrogate model using polynomial chaos expansion approach was used for sensitivity analysis.
- Sobol' sensitivity indices can be obtained directly from the surrogated gPC model.
- Study helps the robust design by evaluating the bounds and reliability based on confidence levels
