8           **Abstract**

9           This paper investigates the non-deterministic linear elastic problem of bar-type functionally  
10          graded porous (FGP) structures with uncertain-but-bounded system parameters. For  
11          achieving a robust uncertainty analysis framework, a non-stochastic structural analysis for  
12          FGP engineering structures, whose system inputs possess interval uncertainties, through the  
13          framework of Finite Element Method (FEM) is proposed. The Timoshenko beam theory is  
14          adopted to incorporate the shear effect, so a more generalized uncertain static analysis of FGP  
15          structures can be anticipated. Various uncertain system input parameters, for example, the  
16          Young's moduli, the dimensions of the cross-sections, the porosities, as well as the applied  
17          loads can be simultaneously incorporated within the proposed method. To demonstrate the  
18          capability of the proposed approach, two distinctive numerical examples have been  
19          thoroughly investigated. Additional numerical experiments have also been conducted to  
20          further explore various effects of uncertainties of different system inputs acting on the overall  
21          FGP structural responses.

22          **Keywords**

23          Functionally graded materials; Porous materials; Composite structures; Uncertain linear  
24          elastic analysis; Timoshenko beam; Non-stochastic FEM.
