## Abstract

This report outlines a highly sensitive and facile electrochemiluminescence (ECL) sensing platform based on a novel high-quantum-yield Au-nanocluster (AuNC) probe for glutathione (GSH) detection. Owing to the prominent quenching effect of GSH on the ECL of the AuNCs, the proposed ECL nanosensor showed a wide response to GSH in the ranges of  $1.0 \times 10^{-9}$ - $1.0 \times 10^{-5}$  M and  $1.0 \times 10^{-5}$ - $1.0 \times 10^{-1}$  M and a low detection limit of  $3.2 \times 10^{-10}$  M. In addition, the proposed system exhibited good selectivity for GSH in the presence of other chemical/biological interferences. Moreover, since no further functionalization of AuNC-based sensor interface was necessary, together with the stability, high sensitivity and selectivity of the proposed nanosensor, this
