This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- **New experiment to measure whether dictators prefer a giving game to a taking game with identical payoff possibilities.**
- **Most dictators prefer the giving game**
- **Aversion to taking is strong: dictators are willing to sacrifice 31% of endowment to avoid taking.**
- **Consistent with Levitt and List's model of social preferences: moral cost of taking exceeds the moral cost of not giving.**
