This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

ERPs differentiate the sensitivity to statistical probabilities and the learning of sequential structures during procedural learning

Author Note

Correspondence and requests for material should be addressed to Dezso Nemeth, Institute of Psychology, Eötvös Loránd University, Izabella utca 46., H–1064, Budapest, Hungary. Telephone: +36703189107. E-mail: nemeth@nemethlab.com.

Highlights

- Multiple parallel learning processes contribute to procedural memory formation.

- Statistical and sequence learning develop along a different temporal trajectory.

- Statistical probabilities are acquired rapidly but sequence learning is gradual.

- The amplitude change of the N2 component is a correlate of both learning processes.
