This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights:

Mindfulness initially increases and then reduces affective LPP amplification.

There is no affective amplification during re-exposure to mindfully viewed images.

These effects are milder in distraction and attentive-viewing control conditions.

In novices a 3-phase emotional adaptation may account for mindfulness effectiveness.
