This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights of paper:  
'A Suicidal Kuznets Curve?'**

- We investigate the link between economic development and well-being
- Suicide rates from a global sample of 73 countries over the period 1990-2010 are empirically explored
- We find evidence of an 'N-shaped' suicidal Kuznets curve between per capita income and suicide rates
- In particular, for males of 25-34, 34-54 and 55-74 age groups and females of the 55-74 age group
- These results remain firm to several robustness checks
