This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The paper studies the incentive problems associated with inventory control in a supply chain, in which an upstream firm (manufacturer) sells goods through downstream firms (retailers).
- Incentive distortions arise when retailers have to allocate inventory over time.
- Different distortions arise with competitive than with exclusive retailers.
- Assigning inventory control to the manufacturer solves these distortions and improves intertemporal price discrimination, but may reduce social welfare.
