This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

### Highlights

- The Arab Spring protests have reduced intra-household differences in labor force participation in Egypt.
- Both women's unemployment and employment increased compared to their husbands.
- The increase in employment is mostly in "low quality jobs", in the informal sector.
- The protests had a negative impact on men's wages and increased their volatility.
- Results are compatible with an intra-household risk sharing mechanism
