This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

***Highlights (for review)**

Highlights of this work include:

- A novel, stochastic, lattice-based model for mycelial network is presented.
- The tip-extension algorithm eliminates the geometrical restriction of the lattice.
- The mycelial growth in porous media is modeled with the thigmotropism mechanism.
- The validated model predicts the biomass invasion and the network densification.
- The discrete microscopic model can be upscaled to a continuous, large-scale one.
