This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

- 1) A new phenomenological model of the dielectric relaxation of hexagonal ice Ih was developed. This model made it possible to explain the experimentally observed complex behavior of the relaxation time and the parameter of broadening of the dielectric loss peak as a function of temperature.
- 2) The origin of the low-temperature crossover of the relaxation time of ice Ih was explained.
- 3) A new expression for the complex dielectric permittivity of ice was obtained.
