This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

*Highlights (for review)

Main **highlights** of our paper are listed as follows:

- **A multi-scenario adaptive neural network is proposed to model pedestrian behavior.**
- **The network inputs include normalization of relative positions among pedestrians and speed direction transfer algorithm.**
- **Both non-competitive and competitive tests show the validity of the proposed network.**
