This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Manuscript PHYSA-171839

Highlights:

- It is shown that a simple pair of two active pores can sustain periodic spikes.
- Spike temporal structure is comparable to real neural pulses.
- Spike periodicity and its statistical properties are well characterized.
- Control parameters are the out cell ionic concentrations.
- The sources of spiking missfunctioning are well established in terms of the system parameters.
