This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We provide a mathematical model to disentangle systemic risk drivers in financial networks.
- We identify the effects of network topology and capital buffer on systemic risk measures.
- We use our methodology to design counterfactual scenarios that are useful for policy makers.
- We apply our methodology to cross-country exposures data from the BIS database.
- We find that network topology explains most of the systemic risk measure's volatility.
