This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights:

We formulate a novel susceptible-exposed-infected-recovered-susceptible delay differential equation epidemic model to describe the popularity evolution of viral videos

Time-delay is used to accurately describe the virtual contact process between individuals and the temporary immunity of individuals to videos after they have grown tired of watching them

Models are validated by fitting model parameters to viewing data from YouTube music videos

Decay rates in the daily views of videos are studied to determine whether they follow a power law or exponential distribution
