This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We connect the topological aspect of the street and meta-information of the city.
- We compare the centrality-based dendrogram with the socio-economic quantities.
- The planned cities are sorted by regularity based on the degree distribution.
- We obtain the scaling law between the street segment length and the population.
- Coevolution of topology and meta-information reveals urban growth mechanism
