This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- Individual contribution increases with his payoff in the last evolutionary step.
- Higher cooperation rate does not always lead to higher wealth on the network.
- High-degree nodes opt out of cooperation when the rich contribute more but the enhancement factor is low.
- Cooperation and wealth equality will be improved when the rich contribute more, as long as the enhancement factor is high enough.
