This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Analytic treatment of consensus achievement in the single-type zealotry voter model

Mikaela Irene D. Fudolig and Jose Perico H. Esguerra

For submission to Physica A

Highlights:

- A single type of zealots was added to the voter model on a complete graph.
- The consensus time was obtained analytically using first-step analysis.
- Consensus time depends on the number of zealots in a power law fashion for large Z .
- The consensus time was found to scale with the size of the population, N .
- Results are similar to those found for the Barabasi-Albert graph.
