Abstract

**Background:** Family presence during resuscitation is not widely implemented in clinical practice. Prior research about nurse factors that may influence their decision to invite family members to remain in the room during resuscitation is contradictory and inconclusive.

**Objectives:** To describe intensive care unit nurses' perceptions, self-confidence, and invitations of family presence during resuscitation, and to evaluate differences according to nurse factors.

**Design:** A cross-sectional survey design was used for descriptive and correlational analyses.

**Setting:** Data collection occurred online.

**Participants:** A convenience sample of 395 nurses working in intensive care units across the United States was obtained.
