## Accepted Manuscript

Detection of unique ebola virus oligonucleotide sequence using fluorescently-labeled phosphorodiamidate morpholino oligonucleotide probe pairs

Yijia Xiong, Tammie J. McQuistan, James W. Stanek, James E. Summerton, John E. Mata, Thomas C. Squier

PII: S0003-2697(18)30624-9

DOI: 10.1016/j.ab.2018.07.006

Reference: YABIO 13074

To appear in: Analytical Biochemistry

Received Date: 13 June 2018

Accepted Date: 12 July 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## **Table of Contents Illustration**

**Figure Legend**: Increased binding selectivity and absence of charge density enables the selective detection of single or double stranded target oligonucleotides using phosphorodiamidate morpholino oligonucleotide (PMO) probes using fluorescence resonance energy transfer (FRET).
