**Running title:** MS/MS of deprotonated sequence-controlled polyurethanes

Graphical Abstract

### Highlights

- ► Small polyurethanes (PUs) were studied to anticipate MS/MS behavior of long chains
- ► Three mechanisms were evidenced for O–(CO)NH bond cleavage in deprotonated PUs
- ► Main issue with long chains was not related to CID but to negative mode ESI yield
- ► A new design of PU end-groups allowed this sensitivity issue to be addressed

### Abstract

MS/MS sequencing is an unrivaled technique to decipher binary information chemically encoded in the backbone of sequence-controlled synthetic polymers constructed with two comonomers of different mass, arbitrarily designated as the 0- and 1-bit of the ASCII alphabet. Efficiency of this "reading" step relies however on the simplicity of MS/MS patterns, which
