This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Implications of Phase Ratio for Maximizing Peak Capacity in Comprehensive Two-Dimensional Gas Chromatography Time-of-Flight Mass Spectrometry

Brendon A. Parsons, David K. Pinkerton, Robert E. Synovec *

Department of Chemistry, Box 351700, University of Washington, Seattle, WA 98198, U.S.A.

Revised version of JCA-16-2350

Prepared for submission to *Journal of Chromatography A*

for the special issue on Comprehensive Two-Dimensional Chromatography

April 20, 2017

Highlights

- Implications of phase ratio, β , between the primary and secondary separations are studied.
- Two-dimensional-peak capacity optimization depends upon the β of both columns.
- The pseudo-isothermal nature of the secondary column separation is verified.
- The β of commercially available columns is a key constraint in peak capacity optimization.
- Full use of the two-dimensional separation space is emphasized.

Abstract

The relationship between the phase ratio, β , of the primary (¹D) and secondary (²D) separation dimensions of comprehensive two-dimensional (2D) gas chromatography (GC×GC)
