#### Abstract

The gold phosphine group in the complex $\mathrm{Os}_{3}(\mathrm{CO})_{10}\left(\mu-\eta^{1}-\mathrm{Ph}\right)\left(\mu-\mathrm{AuPPh}_{3}\right), \mathbf{1}$ can be replaced by mercury halide groups by reactions with mercury halides. The reaction of 1 with $\mathrm{HgI}_{2}$ yielded the new compound $\left[\mathrm{Os}_{3}(\mathrm{CO})_{10}\left(\mu-\eta^{1}-\mathrm{Ph}\right)(\mu-\mathrm{HgI})\right]_{4}, \mathbf{2}$ in $19 \%$ yield. The reaction of 1 with $\mathrm{HgCl}_{2}$ yielded the new compound $\mathrm{Os}_{4}(\mathrm{CO})_{13}\left(\mu-\eta^{1}-\mathrm{Ph}\right)(\mu-\mathrm{Cl})_{3}, \mathbf{3}$ in $18 \%$ yield. When heated to reflux in cyclohexane solvent, compound 2 was converted into the compound $\left[\mathrm{Os}_{3}(\mathrm{CO})_{9}\left(\mu_{3}-\mathrm{C}_{6} \mathrm{H}_{4}\right)(\mu-\mathrm{H})\left(\mu_{3}-\mathrm{Hg}\right)\right]_{2} \mathrm{Os}(\mathrm{CO})_{4}, 4$ in $11 \%$ yield. All new compounds were characterized by single-crystal X-ray diffraction analyses. Compound $\mathbf{2}$ is a tetramer of the unit " $\mathrm{Os}_{3}(\mathrm{CO})_{10}\left(\mu-\eta{ }^{1}-\mathrm{Ph}\right)(\mu-\mathrm{HgI})$ " that is held together by a cubane-like $\mathrm{Hg}_{4} \mathrm{I}_{4}$ core having $\mathrm{D}_{2}$ symmetry. Each triosmium cluster is formally electronically unsaturated and contains one edge-bridging phenyl ligand. Compound 3 contains a $\mathrm{Os}_{3}(\mathrm{CO})_{10}\left(\mu-\eta^{1}-\mathrm{Ph}\right)(\mu-\mathrm{Hg})$ cluster, but in this case the Hg atom bridges to an additional $\mathrm{Os}(\mathrm{CO})_{3}$ group via three bridging chloride ligands. Compound 4 contains two $\mathrm{Os}_{3}(\mathrm{CO})_{9}\left(\mu_{3}-\mathrm{C}_{6} \mathrm{H}_{4}\right)(\mu-\mathrm{H})\left(\mu_{3}-\mathrm{Hg}\right)$ clusters that are linked by a bridging $\mathrm{Os}(\mathrm{CO})_{4}$ group. Each $\mathrm{Os}_{3}$ cluster in 4 contains a triply bridging $\mathrm{C}_{6} \mathrm{H}_{4}$ benzyne ligand and one bridging hydrido ligand.

## Introduction

The phenyl group typically coordinates to a single metal atom as a $\eta^{1}$-ligand serving as a single electron donor, $\mathbf{A}[1]$. Over the years, a number of examples of polynuclear metal complexes containing bridging aryl ligands have been reported. Bridging ligands can coordinate as symmetrical $\eta^{1}$-ligands, $\mathbf{B}[2,3]$ or asymmetrical, $\eta^{1}$ semibridging ligands $\mathbf{C}$ [4] serving as one electron donors; as $\eta^{2}$-D ligands serving as three electron donors [5], or even as various $\sigma+\pi$ coordinated ligands $\mu-\eta^{6}-\mathbf{E}$ or $\mu-\eta^{6}-\mathbf{F}$ serving formally as 7 electron donors [6,7]. Still other coordination modes exist and it is likely that others will be found.

Recently, we reported a family of electronically unsaturated triosmium carbonyl ligands $\mathrm{Os}_{3}(\mathrm{CO})_{10}\left(\mu-\eta^{1}-\mathrm{Ar}\right)\left(\mu-\mathrm{AuPPh}_{3}\right), \quad \mathbf{1}$, Aryl $=$ phenyl $=\mathrm{Ph}, 1,2$-naphthyl, 2-pyryl and 4-pyryl containing bridging aryl ligands of the type B. ${ }^{8}$ Calculations showed that the bonding of the ring to the metal atoms included a significant

F
amount $\pi$-electron donation from the ring to the metal atoms. When heated, these compounds eliminated CO and the edgebridging aryl ligand was converted into a triply-bridging aryne ligand, e.g. eq. (1).

In the present work, we have investigated the reactions of complex 1 with mercuric halides. In the reaction of $\mathbf{1}$ with $\mathrm{HgI}_{2}$, it was found that the bridging $\mathrm{Au}\left(\mathrm{PPh}_{3}\right)$ group was replaced by a bridging HgI group. The product of empirical formula " $\mathrm{Os}_{3}(\mathrm{CO})_{10}(\mu-$ $\left.\eta^{1}-\mathrm{Ar}\right)(\mu-\mathrm{HgI}) "$, then condensed by a self-assembly to form the tetramer, $\left[\mathrm{Os}_{3}(\mathrm{CO})_{10}\left(\mu-\eta^{1}-\mathrm{Ar}\right)(\mu-\mathrm{HgI})\right]_{4}, \mathbf{2}$, in the solid state that is held together by formation of a rare cubane-shaped $\mathrm{Hg}_{4} \mathrm{I}_{4}$ core. The reaction of $\mathbf{1}$ with $\mathrm{HgCl}_{2}$ yielded the compound $\mathrm{Os}_{3}(\mathrm{CO})_{10}(\mu-\mathrm{Ph})(\mu-$ $\mathrm{Hg})(\mu-\mathrm{Cl})_{3} \mathrm{Os}(\mathrm{CO})_{3}, \quad 3$ which contains an unsaturated phenyl bridged $\mathrm{Os}_{3}$ cluster. This is linked to an $\mathrm{Os}(\mathrm{CO})_{3}$ group by a bridging $\mathrm{HgCl}_{3}$ group. When heated compound 2 was converted to the new compound yellow $\left[\mathrm{Os}_{3}(\mathrm{CO})_{9}\left(\mu_{3}-\mathrm{C}_{6} \mathrm{H}_{4}\right)(\mu-\mathrm{H})\left(\mu_{3}-\mathrm{Hg}\right)\right]_{2} \mathrm{Os}(\mathrm{CO})_{4}, \quad 4$ which contains two $\left[\mathrm{Os}_{3}(\mathrm{CO})_{9}\left(\mu_{3}-\mathrm{C}_{6} \mathrm{H}_{4}\right)(\mu-\mathrm{H})\left(\mu_{3}-\mathrm{Hg}\right)\right]$ clusters with each having a triply bridging benzyne ligands. The two $\mathrm{Os}_{3}$ clusters in 4 are linked by a bridging $\mathrm{Os}(\mathrm{CO})_{4}$ group. The results of our studies of the synthesis and characterizations of compounds $\mathbf{2 - 4}$ are described in this report.

## Experimental details

## General data

Reagent grade solvents were dried by the standard procedures and were freshly distilled prior to use. Chromatographic separations were performed on Biobeads, S-X1 gel permeation beads 200-400 mesh, that were obtained from Bio-Rad Laboratories. Infrared spectra were recorded on a Thermo Nicolet Avatar 360 FTIR spectrophotometer. ${ }^{1} \mathrm{H}$ NMR spectra were recorded on a Varian Mercury 300 spectrometer operating at 300.1 MHz . Mass spectrometric (MS) measurements performed by a direct-exposure probe using electron impact ionization (EI) were made on a VG 70S instrument. $\mathrm{Os}_{3}(\mathrm{CO})_{10}\left(\mu-\mathrm{C}_{6} \mathrm{H}_{5}\right)\left(\mu-\mathrm{AuPPh}_{3}\right), \mathbf{1}$ was prepared according to the previously reported procedure [8a].

## Reaction of $\left.\mathrm{Os}_{3}(\mathrm{CO})_{10}\left(\mu_{2}-\mathrm{C}_{6} \mathrm{H}_{5}\right)(\mu \text {-AuPPh })_{3}\right), \mathbf{1}$ with $\mathrm{HgI}_{2}$

43.4 mg ( 0.0955 mmol ) of $\mathrm{Hgl}_{2}$ was added to 84.0 mg $(0.060 \mathrm{mmol})$ of $\mathrm{Os}_{3}(\mathrm{CO})_{10}\left(\mu-\mathrm{C}_{6} \mathrm{H}_{5}\right)\left(\mu-\mathrm{AuPPh}_{3}\right)$ and dissolved in 30 mL of dichloromethane. The reaction was heated to reflux for 15 min . The solvent was removed in vacuo, and the dark green product was then isolated by chromatography on Bio-Beads by using a $4: 1$ hexane/methylene chloride solvent mixture for elution. 16.3 mg ( $19 \%$ yield) of dark green crystals of $\left[\mathrm{Os}_{3}(\mathrm{CO})_{10}\left(\mu-\mathrm{C}_{6} \mathrm{H}_{5}\right)(\mu-\right.$ $\mathrm{HgI})]_{4}, \mathbf{2}$ were obtained following evaporation of the solvent. $\left(\mathrm{Ph}_{3} \mathrm{P}\right)$ Aul is the major colorless coproduct in this reaction. It can be removed with difficulty by a series of fractional crystallizations. Spectral data for 2: IR $\nu_{\mathrm{CO}}$ ( $\mathrm{cm}^{-1}$ in hexane): 2100(m), 2057(s), 2049(m), 2021(m), 2013(s), 1995(m), 1984(w). ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CD}_{2} \mathrm{Cl}_{2}$, $25^{\circ} \mathrm{C}$, TMS, in ppm $) \delta=8.95\left(\mathrm{~d}, 1 \mathrm{H},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}}=6 \mathrm{~Hz}, \mathrm{Ph}\right), 8.76\left(\mathrm{~d}, 1 \mathrm{H},{ }^{3} \mathrm{~J}_{\mathrm{H}}\right.$
$\mathrm{H}=6 \mathrm{~Hz}, \mathrm{Ph}), 8.31\left(\mathrm{t}, 1 \mathrm{H},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}}=6 \mathrm{~Hz}, \mathrm{Ph}\right), 7.15\left(\mathrm{t}, 1 \mathrm{H},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}}=6 \mathrm{~Hz}\right.$, Ph), $6.90\left(\mathrm{t}, 1 \mathrm{H},{ }^{3} \mathrm{~J} \mathrm{H}-\mathrm{H}=6 \mathrm{~Hz}, \mathrm{Ph}\right)$. Mass Spec. EI/MS m/z: 2506 and 1256.

Reaction of $\mathrm{Os}_{3}(\mathrm{CO})_{10}\left(\mu-\mathrm{C}_{6} \mathrm{H}_{5}\right)\left(\mu-\mathrm{AuPPh}_{3}\right), \mathbf{1}$ with $\mathrm{HgCl}_{2}$
21.4 mg ( 0.078 mmol ) of $\mathrm{HgCl}_{2}$ was added to 56.0 mg ( 0.040 mmol ) of $\mathbf{1}$ dissolved in 50 mL of dichloromethane. The reaction was heated to reflux for 15 min . The solvent was then removed in vacuo, and the product was isolated by fractional crystallization by using a hexane/methylene chloride solvent mixture to give 10.0 mg ( $18 \%$ yield) of dark green $\mathrm{Os}_{3}(\mathrm{CO})_{10}(\mu$ -$\mathrm{Ph})(\mu-\mathrm{Hg})(\mu-\mathrm{Cl})_{3} \mathrm{Os}(\mathrm{CO})_{3}$, 3. Spectral data for 3: IR $\nu_{\mathrm{CO}}\left(\mathrm{cm}^{-1}\right.$ in hexane): 2130(m), 2101(m), 2072(w), 2061(s), 2053(m), 2048(m), 2032(w), 2020(m), 2012(s), 2000(m), 1987(w). ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CD}_{2} \mathrm{Cl}_{2}$, $25^{\circ} \mathrm{C}$, TMS, in ppm) $\delta=8.86\left(\mathrm{~d}, 1 \mathrm{H},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}}=6 \mathrm{~Hz}, \mathrm{Ph}\right), 8.82\left(\mathrm{~d}, 1 \mathrm{H},{ }^{3} \mathrm{~J}_{\mathrm{H}}-\right.$
