This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Fatty acids and other biomarkers in two Early Jurassic concretions and their immediate host rocks (Lias δ , Buttenheim clay pit, Bavaria, Germany)

Volker THIEL^{1,*} and Michael HOPPERT²

Highlights

- Hydrocarbons in concretions and host rocks reflect uniform background signal.
- Concretions contain by an order more fatty acids (FA) and α,ω -diacids.
- Selective accumulation, or preservation, of carboxylic acids in concretions.
- Decomposition of FA salts (adipocere) involved in concretion formation?
