Abstract

CF₄ and COF₂ are the two main decomposition products of fluorocarbon gas insulating medium. We explored the gas sensing properties of Ni-MoS₂ to CF₄ and COF₂ based on the density functional theory calculations. The adsorption energy, charge transfer, density of states and electron density difference have been discussed. It was found that the interaction between COF₂ molecule and Ni-MoS₂ is strong, and the adsorption energy is 0.723 eV. Ni-MoS₂ acts as the electron donor and transfers some electrons to COF₂ molecule during the interaction. The adsorption energy of CF₄ on Ni-MoS₂ is lower than that of COF₂, and the interaction between them belongs to physical adsorption. Ni-MoS₂ has the potential to be used as a gas sensor for COF₂ detection using in the field of gas insulated switchgear on-line monitoring.

Keywords: COF₂, CF₄, Ni-MoS₂ monolayer, adsorption, first-principles calculation

1 Introduction

SF₆, which has been widely used in the power industry, is a strong greenhouse gas with the global warming potential (GWP) up to 23500 and the atmospheric lifetime of 3200 years. [1-3] In recent years, fluorocarbon gases such as CF₃I (Trifluoriodomethane), c-C₄F₈ (Octafluorocyclobutane) have been the focus of alternative-gas research due to their excellent environmental and insulating properties [4]. In practical engineering applications, CF₃I and c-C₄F₈ may decompose to produce free radicals such as CF₃• and CF₂• in a discharge. These free radicals can react with trace water or oxygen in the devices, producing some decomposition products such as COF₂ and perfluorocarbons [5]. The generation of the decomposition products is closely related to the insulation status of gas insulating medium. And the formation of toxic products, COF₂, not only poses a threat to the safety of maintenance personnel, but also causes corrosion to the inner wall of the equipment. Therefore, it is necessary to monitor the contents of typical decomposition products.

In recent years, two-dimensional (2D) nanosheets have gained numerous attention. In particular, 2D MoS₂ is proved to be a versatile material for a wide variety of applications such as nanoelectronic devices, catalysis as well as gas sensors [6-8]. Recent researches have shown that MoS₂ nanosheets can sensitively sense a number of molecules. *Late et al.* studied the sensing
