This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

- The structural evolution for the Gr/Co system, as a function of the intercalated Co layer thickness, is herewith investigated;
- the flat-lying adsorption geometry of FePc molecules deposited on Gr/Co substrate, with different degree of corrugation, is determined;
- an interaction mechanism, between the Fe molecule centers and the intercalated Co layer(s), is proposed to be determined by a delicate balance between lateral electric dipoles (due to the rippling of the Gr sheet) and Fe/Co distance.
