This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The transition of GaAs(001) surface from state $\alpha(2\times4)$ into state $(3\times1(6))$ is a complex process involving two transitions, $\alpha(2\times4) \rightarrow DO$ and $DO \rightarrow (3\times1(6))$.
- The transitions $\alpha(2\times4) \rightarrow DO$ and $DO \rightarrow (3\times1(6))$ feature a fixed number of domains over the whole transition process.
- Activation energies of respectively 3.44 ± 0.08 eV and 3.73 ± 0.09 eV were obtained for these transitions.
- The procedure for precise determination of GaAs(001) surface temperature using the features of the $\alpha(2\times4) \rightarrow DO$ transition process kinetic was proposed.
