Optical Characterization Limits of Nanoparticle Aggregates at Different Wavelengths using Approximate Bayesian Computation

Ozan Burak Ericok , Hakan Erturk

PII: S0022-4073(17)30931-7
DOI: [10.1016/j.jqsrt.2018.04.006](https://doi.org/10.1016/j.jqsrt.2018.04.006)
Reference: JQSRT 6052

To appear in: *Journal of Quantitative Spectroscopy & Radiative Transfer*

Received date: 5 December 2017
Revised date: 4 April 2018
Accepted date: 6 April 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Optical characterization of dilute nanoparticle aggregates considered
- Monodisperse and polydisperse soot aggregates are considered
- Approximate Bayesian Computation is used for solution of inverse problem
- Characterization limit change with light source wavelength identified
