This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Submitted to JQSRT, November 30th, 2017, revision submitted on January 24th, 2018

Highlights

- A photonic thermal diode based on asymmetric nanostructures is proposed.
- The rectification ratio is higher than that of planar bulks by over 10 times.
- Nanostructures have a higher forward radiative heat flux due to the lower loss.
- The reversed heat flow is inhibited due to smaller cut-off wavevectors.
