This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Three-ply core-sheath graphene fiber supercapacitors with thin and continuous wrinkling gel electrolyte interlayer, which are fabricated by a facile and direct spinning through an elaborately designed spinneret with a coaxial three-channel structure, show high specific capacitance, cycling stability and energy density.
