This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Graphical abstract

Growth competition between dendritic bi-crystals of orientations α_1 and α_2 is simulated with a Phase Field (PF) model and with a Cellular Automaton (CA) model. Maps of the grain boundary orientation angle, θ , are computed for the full spectrum of bi-crystals orientation (α_1 , α_2). Quantitative PF vs. CA comparison is provided based on a statistical analysis of the maps.
