Abstract

$\text{Ca}_{3-x}\text{Sm}_x\text{Co}_4\text{O}_{9+\delta}$ ($0 \leq x \leq 0.3$) samples were fabricated by the sol-gel method followed by spark plasma sintering in vacuum. The high-temperature thermoelectric properties of the $\text{Ca}_{3-x}\text{Sm}_x\text{Co}_4\text{O}_{9+\delta}$ were also studied, with an emphasis placed on the partial substitution of Sm^{3+} for Ca^{2+} . The sintered $\text{Ca}_{3-x}\text{Sm}_x\text{Co}_4\text{O}_{9+\delta}$ formed a monoclinic $\text{Ca}_3\text{Co}_4\text{O}_9$ phase and exhibited fine lamellar grains and dense morphology. With increased Sm^{3+} content, the electrical and thermal conductivities decreased, whereas the Seebeck coefficient significantly increased. Of the prepared samples, $\text{Ca}_{2.7}\text{Sm}_{0.3}\text{Co}_4\text{O}_{9+\delta}$ had the largest dimensionless figure-of-merit (0.175) at 800 °C. The results showed that the partial substitution of Sm^{3+} for Ca^{2+} in $\text{Ca}_3\text{Co}_4\text{O}_{9+\delta}$ is effective for enhancing its thermoelectric properties.
