This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Surfactant-free synthesis of m-BiVO₄ nanoribbons and enhanced visible-light photocatalytic properties

Graphical abstract

Highlights:

1. m-BiVO₄ nanoribbons were synthesized by solvothermal route.
2. m-BiVO₄ exhibited enhanced photocatalytic activity and stable recyclability.
3. The superior performance can be ascribed to the low band gap, high surface area and unique morphology.
