This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

### Research highlights

We report the first theoretical investigation of surface plasmon polariton (SPP) waves of a random nanocomposite film, consisting of bulk metal embedded with dielectric inclusions.

We find that the number of SPP modes of the system is twice the number of the corresponding SPP modes of a conventional metallic film.

We show the random nanocomposite films offer high flexibility in the plasmonic system design.
