This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Oxidation behavior of a Ni-Fe support in SOFC anode atmosphere**Na Xu<sup>a,b,c</sup>, Ming Chen<sup>b\*</sup>, Minfang Han<sup>a,c,d\*</sup>,<sup>a</sup> School of Chemical and Environmental Engineering, China University of Mining and Technology, Beijing 100083, China<sup>b</sup> Department of Energy Conversion and Storage, Technical University of Denmark, Roskilde DK-4000, Denmark<sup>c</sup> State Key Laboratory of Power Systems, Department of Thermal Engineering, Tsinghua University, Beijing 100084, China<sup>d</sup> Tsinghua Innovation Center in Dongguan, Dongguan 523808, China

Abstract: In this work, we investigated the long-term oxidation behavior of a Ni-Fe (1:1 weight ratio) support for solid oxide fuel cell (SOFC) applications. Ni-Fe supports were obtained through tape casting, high temperature sintering and pre-reducing in 97% H<sub>2</sub>/N<sub>2</sub> (9/91)-3% H<sub>2</sub>O at 750 and 1000 °C, respectively. Then the Ni-Fe supports were exposed in simulated anode atmospheres of 97% H<sub>2</sub>/N<sub>2</sub> (9/91)-3% H<sub>2</sub>O and 75% H<sub>2</sub>/N<sub>2</sub> (9/91)-25% H<sub>2</sub>O for periods of up to 1000 h at 750 °C. The samples were examined for mass change, phase and chemical composition, and microstructure evolution during the annealing process. The Ni-Fe supports exposed to H<sub>2</sub>/N<sub>2</sub>-3% H<sub>2</sub>O showed negligible oxidation, while those exposed to H<sub>2</sub>/N<sub>2</sub>-25% H<sub>2</sub>O showed a 4-6% mass increase, due to the fact that a Fe-rich oxide scale was found on the surface of the Ni-Fe alloy particles. Room-temperature conductivity measurements showed that the supports annealed in the two atmospheres maintained sufficiently high conductivity. The results from the current work demonstrate that the porous Ni-Fe support can be well employed in SOFCs, especially metal-supported SOFCs.

**Keywords:** Ni-Fe support; Oxidation resistance; Metal-supported solid oxide fuel cell; Electrical conductivity

Solid oxide fuel cell (SOFC) technology has made significant progress over the past decades owing to improvements in materials, production techniques and other related technologies<sup>[1-3]</sup>. However, cost is still one of the main obstacles hindering the commercialization of SOFC technology<sup>[4]</sup>. Research into SOFC-based auxiliary power plant (APU) systems shows that a large part of the overall cost is the material cost of the SOFCs, which accounts for ~30 - 40% of the total system cost across the analyzed production volume. In addition, the high operation temperature of SOFCs imposes rigid requirements on stack components, such as the requirement of high-temperature alloys for interconnects (ICs) and thermal insulation materials,
