This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Production of CNT-bearing melt-spun Al-2Sc-0.05CNT alloys**M. Fatih Kilicaslan<sup>a</sup>, Ercan Karaköse<sup>b</sup><sup>a</sup>Kastamonu University, Department of Materials Science and Nanotechnology Engineering, Kastamonu-Turkey<sup>b</sup>Karatekin University, Faculty of Sciences, Department of Physics, 18100 Çankırı – Turkey**Abstract**

In the present work, rapidly solidified Al-2Sc-XCNT (X= 0, 0.05) alloys were successfully fabricated by melt spinning under Ar atmosphere. The effects of addition of CNT on the microstructural, thermal, microhardness, and electrical properties were investigated by using scanning electron microscopy (SEM), X-ray diffractometer (XRD), differential calorimeter (DSC), Vickers microhardness testing and a four point probe resistivity tester. Experimental results illustrated that the addition of 0.05 wt. % CNT to melt-spun Al-2Sc alloys led to the formation of equiaxed globular-like morphologies with size from 0.3 to 2.7µm in. In the microstructure of Al-2Sc-0.05CNT alloy, CNTs covered by Al with size (width and length) changing from 40 to 55 nm and 255 to 295 nm, respectively, were observed. The addition of CNT led to a net increment (~25%) in microhardness values due to solitary strengthening of the carbon nanotubes, solute solution hardening and modification of the morphologies of Al<sub>3</sub>Sc intermetallics. In addition, because of CNT addition there was a decrease in the electrical resistivity.

**Keywords:** Al-Sc alloys; Microstructure; Melt spinning; Microhardness, Carbon nanotube
