This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Effect of co-flow and directed co-flow with positive and negative angles is studied.
- Numerical results are found to be in good agreement with experimental data.
- High entropy generation corresponds to lower co-flow.
- High values of entropy generation are near the nozzle exit.
- The Merit number increases with the co-flow velocity.
