Stiffness and damping models for the oil film in line contact  
elastohydrodynamic lubrication and applications in the gear drive

Changjiang Zhou , Zeliang Xiao

PII: S0307-904X(18)30222-1  
DOI: [10.1016/j.apm.2018.05.012](https://doi.org/10.1016/j.apm.2018.05.012)  
Reference: APM 12276

To appear in: *Applied Mathematical Modelling*

Received date: 11 August 2017  
Revised date: 6 May 2018  
Accepted date: 15 May 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## Highlights

- New stiffness and damping models are developed for oil film in normal and tangential directions.
- Smaller lubricant stiffness is beneficial for alleviating gear meshing impact and shear vibration.
- Meshing impact and friction heat is suppressed by either larger normal lubricant damping or smaller tangential lubricant damping.
- Better combined stiffness and damping can be achieved by optimizing gear geometric parameters and operating conditions.
