This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- A nonlinear strategy of control parameter and a modified position- updating-equation are presented.
- The proposed algorithm is used to solve large-scale global optimization problems.
- Only 15,000 number of Function evaluations are required to solve all dimensional functions.
- It is a low computational cost optimization technique.
- It converges fast as compared to other population-based optimization algorithms.
