This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A mixed-integer linear programming model is developed for supply chain network design problem of a firm in the food sector
- Decisions include opening and capacity acquisition at a new plant, capacity expansion at existing plants, shipment amounts
- To obtain a robust solution against demand uncertainty minimax regret approach is adopted
- The plant to be opened as suggested by the robust solution of the model is confirmed and implemented by the firm
