This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

ACCEPTED MANUSCRIPT

Highlights

- Parametric loudspeaker arrays exploit nonlinear wave propagation to generate focused sound
- The convolution model predicts the far-field directivity of planar parametric loudspeaker arrays
- The convolution model is extended to parametric loudspeaker arrays set on curved surfaces
- The extended model is applied to spherical omnidirectional parametric loudspeakers
- The performance of different distributions of transducers for omnidirectional loudspeakers is analyzed
