This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- A fast model for unsteady flows in circular channels is presented
- Channels have a small aspect ratio but can have large diameter variations
- The simplified model is up to 2 orders of magnitude faster than CFD
- It accounts for some inertia with no restrictions on forcing frequency or shape
- The model can be applied to a wide spectrum of problems in MEMS and bio-mechanics
