This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- A new model to handle certain two-stage decision problems under uncertainty is developed and a method for solution to this model is tested and compared with an existing method.
- In particular, it is shown that, by reformulation, the new model is equivalent to a conic convex optimization problem.
- The format of the new model's required input is unified, thus is convenient for users in practice.
