This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- A closed-form dynamic model of highly flexible 3D manipulators with links of arbitrary shape is proposed
- In order to account for large deformations a substructuring method is formulated
- The data describing the links flexibility are obtained as result of a FE preprocessing stage
- The model is validated by comparison with experimental results and multibody software
- An integral manifold model, suitable for the design of advanced control systems is finally derived.
