9 **Abstract**

10 An improved dynamic downscaling method is introduced in the present study to
11 discern the spatial variations in offshore wind resources over the China coastal waters.
12 In the improved method, the authors develop a novel pre-processing technique to
13 provide the lateral boundary and initial conditions for the main dynamic downscaling
14 process. In detail, the multivariate orthogonal decomposition is employed, at first, to
15 extract the time-independent componential wind fields from the 30-year regional
16 ECMWF meteorology data, which are then used to run the Weather Research and
17 Forecast (WRF) model to produce the offshore wind field with high spatial
18 resolutions from dynamical downscaling. Given the contribution of each
