This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- Reinforcement learning is used to optimize energy efficiency of hot water systems
- Optimization is done based on learnt system dynamics and occupant behaviour
- No prior model or information is assumed about hot water system or occupant
- Energy efficiency gains of 20% are obtained by applying the framework to 32 houses
- No loss of user comfort is observed in a set of 5 houses fitted with extra sensors
