This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Solar assisted district heating was studied for an existing district heating system
- Performance of distributed and centralised solar collector systems was evaluated
- Centralised collector systems can provide cost savings from 7-21 %
- Pay-back times between 10 and 11 years for centralised systems were recorded
- Low temperature distribution gave a boost in performance for centralised collectors
