This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## ACCEPTED MANUSCRIPT

## Highlights

- We develop a database of craters on and around lapetus's ridge.
- We assess the relative age of the ridge from differences in cratering.
- We use the crater database to analyze various ridge formation hypotheses.
- The relative age of the ridge is younger with an enhanced small impactor population.
- Ridge growth via a disrupted sub-satellite is most consistent with these results.
