This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## Highlights

- Exact evaluation of crater chronology models using Poisson statistics and Bayesian inference, yielding a likelihood function with an intrinsic uncertainty
- Poisson timing analysis technique supersedes binning/fitting approaches to crater-count dating
- Technique permits order-of-magnitude estimate of age for surface units showing no craters at all
- New notation makes chronology model calibration errors inseparable from stated crater model ages
