This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Behaviour of strange quark matter and magnetic field for LRS Bianchi type-I model is studied in $f(R; T)$ gravity.
- Bilinear and special form of deceleration parameter is used to obtain the solutions of the Einsteins field equations.
- Both the cases we obtain acceleration expansion of the universe.
- The models obtained here with three different deceleration parameter represents expanding, shearing and an anisotropic universe.
- In the early universe the magnetic flux has more effects and its effects gradually reduces in later stage.
